# 1 Introduction

This is an application to browse and evaluate university courses, called **Student-Evaluation**. The application is developed to allow students (users) to view all the courses of a specific university with related comments.

Looking the table on the right side, a user can browse all subjects and by clicking an element of this table, on the left section, the user can see more information about the chosen element: general information and comments.

In order to filter the list of subjects, there is a choice box, thanks to which the user can select a specific degree course.

In order to leave a comment, it is necessary to log in, otherwise, the application will allow interaction in read-only.

There are two buttons in the bottom left corner to allow students to update or delete their comments. There is no form to register into the application, it is assumed that users are already registered into the system, but there is an administrator that can add, update and delete subjects and all the informations related.

The mockup shows a web application interface with the following components:

- Top Section:** A horizontal container with a "Username" label and input field, a "Password" label and input field, and a "Login" button.
- Filter Section:** Two dropdown menus labeled "Prof" and "Degree" with downward-pointing arrows.
- Main Content Area:**
  - Left Column:** A vertical stack of four boxes. The top box is labeled "Course / prof informations". The following three boxes are each labeled "Comment".
  - Right Column:** A large box containing a list of elements, labeled "List element 1", "List element 2", and "...".
- Bottom Section:** A horizontal container with a "Leave comment ..." input field on the left, and three buttons labeled "Comment", "Delete", and "Update" on the right.

Figure 1: Mockup

## **2 Analysis and workflow**

### **2.1 Requirements**

#### **2.1.1 Functional requirements**

The system has to allow the guest to carry out basic functions such as:

- To select a course from the list and view information and comments.
- To select a degree course from the list, filtering subjects.

In addition to the guest functions, the system has to allow the user to carry out basic functions such as:

- To login to the system.
- To upload comments on a course.
- To update a comment of a course only if the user is the owner.
- To delete a comment of a course only if the user is the owner.

The system has to allow the administrator to carry out basic functions such as:

- To login to the system.
- To add a course.
- To update a course.
- To delete a course.
- To associate a professor to a course.
- To delete any comment.

#### **2.1.2 Non-functional requirements**

- Usability, ease of use and intuitiveness of the application by the user.
- Availability, with the service guaranteed 24/7.
- The system should support simultaneous users.
- The system should provide access to the database with a few seconds of latency.

## 2.2 Use cases

### Actors

- Guest : this actor represents a user who is not logged into the system
- Student : this actor represents a user who is logged into the system
- Admin : this actor represents the administrator of the system

#### 2.2.1 Use Cases Description

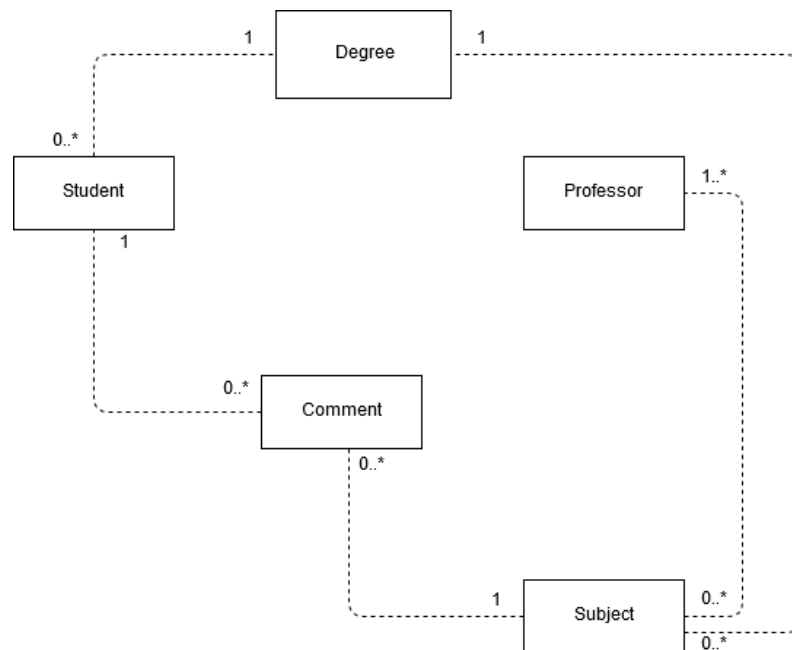

Event	UseCase	Actor(s)	Description
Log in, Log out	Login, Logout	Admin, Student	The user logs in/out the application. The system browses the professors' list by the degree course of the logged user and returns it on the interface.
View all the subjects	Browse, Find, View P/S	User	The user chooses that he wants to view the list of all subjects. The system browses the data on the db and returns them on the interface.
View the comments and information of a subject	Browse, Find, View C	User	The user clicks on a record of the subject table. The system browses on the db the comments related to that subject and returns them on the interface.
Add a comment	Add C	Admin, Student	The user submits the text of his comment. The system updates the db and the interface.
Update a comment	Update C	Admin, Student	The user selects the comment and commits the new text. The system updates the db and the interface.
Delete a comment	Delete C	Admin, Student	The user selects the comment and submits the delete. The system updates the db and the interface.
View the subjects by degree	Browse, Find, View P/S	User	The user selects from the choice-boxes the degree course and the list (subjects) he's interested in. The system browses on the db the subjects filtered by the chosen degree and returns them on the interface.
Add a subject	Add P/S	Admin	The user submits the name and other information of the new subject. The system updates the db and the interface.
Update a subject	Update P/S	Admin	The user selects the subject and commits the new information. The system updates the db and the interface.
Delete a subject	Delete P/S	Admin	The user selects the subject and submits the delete. The system updates the db and the interface.

**Figure 2:** Use cases diagram

## 2.3 Analysis of entities

This diagram represent the main entities of the application and the relations between them.

**Figure 3:** UML analysis diagram

## 3 Design

### 3.1 Database Choice

This application is based on many join operations between the entities, in order to obtain each professor associated with a subject, or each comment associated with a subject, or yet display all the subjects associated with a degree course. For this reason, if the amount of data available is very high as expected, a relational database will be computationally expensive. Then the choice fell on a graph database, which manage to work very well and very fast on a model made with a lot of entities and relations.

### 3.2 Software Architecture

The application is designed over 2 different layers, see figure 4:

- Front-end
- Back-end

**Figure 4:** Software architecture diagram

### 3.3 Structure of the database

In graph databases the entities are modeling using the vertexes; in our model there are the following entities:

- Professor
- Student
- Degree
- Subject
- Comment

Moreover the relations are modeling using the edges; in our model there are the following edges:

- Attends, connects a student to a degree

- 
- \*(40) Student(5) Degree(6) Professor(15) Subject(14)
- \*(35) ATTENDS(5) TEACHES(16) BELONGS(14)

7

## 4 Implementation

### 4.1 Used Technologies

The application is developed in java programming language, version 11.0.4, and in JavaFX system to create the GUI, version 11, so it should run on each platform in which JVM is installed, but the application is tested and guaranteed on Ubuntu 16 and Window OS. Moreover Maven is used to build and maintain the project, version 3.8.0.

The java driver for Neo4j manages the communication between the client application layer and the database backend layer, version 3.2.1.

For the backend layer it is used a graph database: Neo4j, version 3.2.1.

So this application is tested using these technologies, considering these particular versions: for other versions the correct execution isn't guaranteed .

### 4.2 Java Classes Description

#### 4.2.1 Entities

In this section is listed the classes who model the entities.

- Student
- Professor
- Subject
- Comment
- Degree

Each of them have some attributes and the related Get and Set methods, in order to avoid too much redundancy code, it is reported only an example of declaration.

```
public class Student{
    private final SimpleIntegerProperty id;
    private final SimpleBooleanProperty admin;
    private final SimpleStringProperty username;
    private final SimpleStringProperty password;
    private final SimpleObjectProperty<Degree> degree;

    public Student(int i, String u, String p, Degree d, boolean a) {
        id = new SimpleIntegerProperty(i);
        admin = new SimpleBooleanProperty(a);
        username = new SimpleStringProperty(u);
        password = new SimpleStringProperty(p);
        degree = new SimpleObjectProperty(d);
    }

    public int getId(){ return id.get(); }
    public void setId(int i){ id.set(i); }
    public boolean getAdmin() { return admin.get(); }
    public void setAdmin(Boolean b) { admin.set(b); }
    public String getUsername() { return username.get(); }
    public void setUsername(String n) { username.set(n); }
    public String getPassword() { return password.get(); }
```

```

    public void setPassword(String n) { password.set(n); }
    public Degree getDegree() { return degree.getValue(); }
    public void setDegree(Degree d) { degree.set(d); }
}

```

#### 4.2.2 Database manager

The other important class in the project is the DbManager. It handles the connection with Neo4j and provides all methods to interact with it.

```

public class DbManager implements AutoCloseable {
    private final Driver driver;
    private final String uri = "bolt://localhost:7687";
    private final String user = "user";
    private final String password = "pwd";

    public DbManager() {
        driver = GraphDatabase.driver(uri, AuthTokens.basic(user, password));
    }

    // ... crud operation ...

    @Override
    public void close() throws Exception {
        driver.close();
    }
}

```

### 4.3 CRUD operations

All crud operations are implemented using **Cypher query language**; it is a declarative graph query language that allows for expressive and efficient querying and updating of a property graph.

#### 4.3.1 Create

This method of DbManager class guarantees the creation of a subject. A new vertex is inserted on the graph and is connected with a professor node using an incoming edge called TEACHES, moreover it is connected with degree node, using an outgoing edge called BELONGS.

```

public void createSubject(String name, int credits, String info, int profId, int degreeId) {
    try(Session session = driver.session(AccessMode.WRITE)){
        session.run("MATCH (p:Professor) WHERE id(p) = $profId " +
            "MATCH (d:Degree) WHERE id(d) = $degreeId " +
            "CREATE (a:Subject {name:$name, cfu:$cfu, info:$info})," +
            "(p)-[:TEACHES]->(a), (a)-[:BELONGS]->(d);",
            Values.parameters("name",name,"cfu",credits,"info",info,
                "profId",profId,"degreeId",degreeId) );
    }
}

```

#### 4.3.2 Read

This method reads from database all degrees and inserts them in a list.

```

public List<Degree> getDegreeCourses() {
    List<Degree> list = new ArrayList<>();

    try(Session session = driver.session(AccessMode.READ)){
        StatementResult sr = session.run("MATCH (dd:Degree)'+
                                           "RETURN ID(dd), dd.name;");

        while(sr.hasNext()) {
            Record r = sr.next();
            System.out.println(r.toString());
            list.add(new Degree(r.get("ID(dd)").asInt(),r.get("dd.name").asString()));
        }
    }
    return list;
}

```

### 4.3.3 Update

The following snippet of shows how to execute an updating operation of an entity professor.

```

public void updateProfessor(int profId, String name, String surname) {
    try(Session session = driver.session(AccessMode.WRITE)){
        session.run("MATCH (p:Professor) WHERE ID(s) = $profId\n" +
                    "SET p.name = $name, p.surname = $surname;",
                    Values.parameters("profId",profId,"name",name,"surname",surname) );
    }
}

```

### 4.3.4 Delete

This example of deleting operation shows how to remove subject, given its id and related relations.

```

public void deleteSubject(int subjectId) {
    try(Session session = driver.session(AccessMode.WRITE)){
        session.run("MATCH (n:Subject)" +
                    "WHERE id(n) = $idSubject" +
                    "DETACH DELETE n;",
                    Values.parameters("idSubject",subjectId));
    }
}

```

## 5 User Manual

When you first run the application, the interface you get is the one in figure 6.

The interface is titled "Students Evaluations". It features a login section with "Username:" and "Password:" labels, each followed by a text input field, and a "Login" button. Below the login section is a placeholder box with the text "Informations about Professors are visualized here". To the right of this placeholder is a table with three columns: "ID", "NAME", and "SURNAME". The table is filtered by "All" professors. Below the table is a comment section with a text input field labeled "Leave a comment here..." and three buttons: "Comment", "Delete", and "Update".

ID	NAME	SURNAME
4	Giuseppe	Anastasi
2	Luigi	Berselli
9	Leonardo	Bertini
7	Mario G.C.A.	Cimino
3	Marco	Cococcioni
1	Giuseppe	Lettieri
5	Francesco	Marcelloni
8	Alessandro	Paoli
6	Giovanni	Stea

**Figure 6:** First view of the application

The default display includes the list of all registered professors in the table on the right. You can choose to display the professors of a single degree course, using the drop-down menu on the right (fig. 7), or decide to view the list of subjects (fig. 8), for which is also available the degree course's filter.

The interface is titled "Students Evaluations". It features a login section with "Username:" and "Password:" labels, each followed by a text input field, and a "Login" button. Below the login section is a placeholder box with the text "Informations about Professors are visualized here". To the right of this placeholder is a table with three columns: "ID", "NAME", and "SURNAME". The table is filtered by "Ingegneria Informatica" professors. Below the table is a comment section with a text input field labeled "Leave a comment here..." and three buttons: "Comment", "Delete", and "Update".

ID	NAME	SURNAME
4	Giuseppe	Anastasi
2	Luigi	Berselli

**Figure 9:** Application interface after the user "Alice" has logged in

If you now want to be able to see the comments associated with a particular professor, you have to click on the name of the professor: in the table on the left the list of comments already received will appear (fig. 10). With this operation, you'll be able to visualize also the information related to that professor.

To leave a comment, you need to enter the text in the field below the table and then click on the "Comment" button. The result obtained from these operations is shown in fig. 11.

You can also decide to modify the comment you just uploaded or another comment you made on a previous session. To do so, you need to click on the comment you want to update, change

All these operations are available for the subjects as well. The only difference is that when you want to add a new subject you also need to specify the id of the professor teaching it (or a list of ids, separated by commas, if there are more professors teaching it). Moreover, you must have precisely displayed in the table the subjects of the same degree course of the new one (fig. 16).
